Dear Hiring Team,

I am writing to apply for the Lead Software Engineer, Data and MarTech role at America's Test Kitchen. The role sits at exactly the intersection I have worked in for years: building reliable data platforms, partnering with product and analytics stakeholders, and helping Scrum teams deliver work that holds up in production.

At Context Labs, I led a distributed engineering organization delivering a multi-tenant analytics platform. My team owned how data was modeled, accessed, and delivered across product, reporting, and geospatial use cases. I built the production data-service layer in Node.js and TypeScript (GraphQL BFF), integrating with Java APIs behind multi-tenancy, access controls, and localization. I worked closely with product and analytics partners to shape relational data models and APIs that supported dashboards, charting, and operational reporting. Along the way, I introduced engineering practices — code review, testing, and monitoring — that improved data trust and cut incident recovery time by 50%.

Before that, as Lead Engineer at Filtered.ai, I built AWS-backed data and ML workflows on PostgreSQL: ingestion, validation, scoring, and reporting for enterprise recruiting teams. I collaborated with product and data science on model integration and quality checks, and I owned the full delivery of pipelines that needed to be correct, not just fast.

Earlier in my career, I spent time in publishing and ad-tech at Say Media, working on audience data, campaign delivery, and content platforms. That background gives me an intuitive read on what MarTech systems are for — connecting editorial and product decisions to the data that proves what is working.

What draws me to ATK is the chance to do this work for a brand built on trust. Recipe and content organizations live or die on whether their data is accurate, timely, and usable by the people making decisions. I am comfortable navigating ambiguity, making architectural calls with incomplete requirements, and breaking large initiatives into sprint-sized work. I also care about raising the team around me: mentoring engineers, setting quality standards, and making delivery more predictable over time.

I would welcome the chance to discuss how my experience with Python, TypeScript, Node.js, AWS, PostgreSQL, and analytics platform delivery could support ATK's data and MarTech goals.

Thank you for your consideration.

Sincerely,
David Marr
