Dear Envisioning Studio team,

I am applying for the Creative Systems Engineer role. The description reads like work I have been doing, often without the title: building the machinery underneath experiments so creative and product people can move faster.

At Context Labs, I led platform engineering for a multi-tenant analytics product. While feature teams built experiences on top, my work was the substrate — a Node.js/TypeScript GraphQL layer wiring Java APIs, databases, auth, and localization into something stable enough to prototype against. I also drove adoption of AI coding assistants and MCP tooling across the organization, with workshops and guardrails so teams could treat agents as infrastructure, not novelty.

Before that at Filtered.ai, I integrated models, human-in-the-loop services, and AWS pipelines into a hiring product. The job was less about polishing UI and more about making ingestion, scoring, and workflow services actually run together in production.

Earlier roles reinforced the same pattern: wiring cameras, payments, and gate hardware at OneMarket; bridging speculative UI ideas to Perl services at Tilt; design-to-production prototyping at Frog Design. I am comfortable when the brief is fuzzy, the stack is heterogeneous, and the goal is to make an idea real enough to learn from.

Outside work, I run a home Kubernetes cluster (Talos, Flux, GitOps) and document it publicly. That is not resume padding — it is how I stay fluent in containers, networking, and the failure modes that show up when you operate your own infrastructure.

What excites me about Envisioning Studio is the mandate to treat agentic AI as a new systems primitive and ship speculative work without pretending ambiguity does not exist. I would welcome the chance to build the environment that lets your creative technologists experiment with confidence.

Thank you for your consideration.

Sincerely,

David Marr
