Dear Envisioning Studio team,

I am applying for the Creative Systems Engineer role. The description reads like work I have been doing, often without the title: building the backend and infrastructure underneath experiments so other people can move faster.

At Context Labs, I owned platform infrastructure for a multi-tenant analytics product. My work was the substrate — a Node.js/TypeScript GraphQL layer wiring Java APIs, PostgreSQL, auth, tenancy, and localization into services stable enough to prototype against. I defined service boundaries, improved observability, and cut incident recovery time by 50%. I also drove adoption of MCP server tooling and AI-assisted development as infrastructure, with guardrails so teams could experiment with agents on real systems.

Before that at Filtered.ai, I built the backend machinery on AWS and PostgreSQL — ingestion, scheduling, scoring pipelines, and workflow services connecting models and human-in-the-loop validation to production. The job was wiring services together, not polishing UI.

Earlier roles reinforced the same pattern: orchestrating cameras, payments, and gate hardware at OneMarket; Perl/Dancer services and PostgreSQL at Tilt; enterprise integrations and industrial automation backends earlier in my career. I am comfortable when the brief is fuzzy, the stack is heterogeneous, and the goal is to make an idea runnable.

Outside work, I run a home Kubernetes cluster (Talos, Flux, GitOps, SOPS secrets) and document it publicly. That is how I stay fluent in containers, networking, storage, and the failure modes that only show up when you operate your own infrastructure.

What excites me about Envisioning Studio is the mandate to treat agentic AI as a new systems primitive and ship speculative work without pretending ambiguity does not exist. I would welcome the chance to build the environment that lets your creative technologists experiment with confidence.

Thank you for your consideration.

Sincerely,

David Marr
